

## ORB External API v1.0.2 — Mini Release Notes

This release updates the ORB External API documentation and OpenAPI specification previously shared as v1.0.1.

- **Organisation Contract Signing**
  - Added organisation contract status and access-token endpoints to support ORB-hosted contract signing within an iframe.
  - Until the organisation contract has been signed, only organisation onboarding and contract-related endpoints are available.
  - Protected organisation, user, patient, branding and Widget operations return 403 OrganisationContractNotSigned until contract signing has been completed.
- **EHR Linking Branding**
  - Added an organisation branding endpoint for configuring the logo and welcome text shown during the patient NHS-linking journey.
  - The branding endpoint requires the organisation contract to be signed; until then it returns 403 OrganisationContractNotSigned (same gate as other protected operations).
  - After a successful update, branding is applied immediately on the patient NHS-linking page.
- **Clinical User Classification**
  - Added the isClinician field to the User model.
  - Only users classified as clinicians can access patient NHS information through the ORB Widget.
  - Existing isLocum and authorisedSignatory fields remain unchanged.
- **Patient Connection Information**
  - Patient Connection Status may now return the patient's NHS number where this has been obtained through NHS Login.
  - The NHS number remains read-only and cannot be supplied through the EHR API.
  - The NHS number is available on supported patient responses and may be used as a filter when listing patients.
  - Patient responses may also include oldestNhsRecordDate, indicating the earliest NHS record currently available for the patient.
- **Patient Registration Link Validity**
  - Clarified that patient registration links expire after a configurable period, seven days by default.
  - Generating a new link invalidates the previous one and restarts the expiry period.
  - Expired invitations now transition to the InviteExpired connection status.
- **Data-Access Consent Links**
  - Clarified that data-access consent links are separate from patient registration links.
  - Consent links do not have an independent invitation-token expiry.
  - Existing request limits continue to apply separately to registration invitations and data-access requests.
- **Remove Patient Connection**
  - Clarified that removing a patient connection only unlinks the patient from the specified organisation.
  - The patient's ORB account, NHS registration, NHS data and connections to other organisations are retained.

- **Clinician Widget Terms & Conditions**
  - Clarified that clinician Widget Terms & Conditions are separate from the organisation contract.
  - They must be accepted individually by each clinician for each organisation.
  - NHS data remains unavailable within the Widget until the clinician has accepted the applicable Terms & Conditions.
- **Separate Embedded Journeys**
  - Clarified that the organisation contract-signing iframe is separate from the clinician NHS records Widget.
  - EHR integrators must embed and handle these as separate user journeys.
- **General updates:**
  - Aligned the API Guide, Widget Integration Guide and OpenAPI specification.
  - Updated status codes, JWT claims and integration examples to match the implementation.
  - Removed obsolete “under discussion” notes.
  - Added an exact document date and a reference to the Mini Release Notes.
  - Corrected PDF export encoding
  - Clarified common errorCode values (including PatientDetailsMismatch and UnsupportedMediaType) and API-key authentication responses (401 missing key, 404 ClientNotFound, 403 ApiKeyExpired) in the API Guide and OpenAPI specification.
