

## ORB External API v1.0.3 — Mini Release Notes

This release updates the ORB External API documentation and OpenAPI specification previously shared as v1.0.2.

- **Optional create fields**
  - Organisation phoneNumber is optional on create (may be omitted or empty).
  - User professionalRegNumber is optional on create (may be omitted or empty).
- **Data-access requests after Reviewed**
  - Connect issues a data-access request email/link only while dataAccessStatus is RequestNotSent or RequestSent (and not when connectionStatus is DataMismatch).
  - After Reviewed, Connect does not send or return another data-access request.
  - For missing permissions, use Get Granted Permissions and your own patient messaging — not Connect.
- **Patient connection rate limits**
  - ORB may rate-limit patient connection emails/links per patient, per organisation, over a rolling 24 hours.
  - One configured maximum is counted separately for:
    - NHS invitation emails/links; and
    - data-access request emails/links.
  - Exceeding the relevant limit returns 429 with errorCode ResendLimitExceeded.
  - If no limit is in force, connect calls are not rejected for rate limiting.
- **Resend flag**
  - resend: true applies only to NHS invitation reminders while connectionStatus is InviteSent.
  - Data-access reminders do not require resend; they are gated only by the data-access rate limit.
- **Access token / widget access errors**
  - Limited patient/GP data access on access-token now returns 403 with errorCode PatientDataAccessLimited (previously this case was conflated with PatientInvalidStatus).
  - Patient not Connected remains 403 PatientInvalidStatus.
- **Patient demographics / conflict errors**
  - Request vs ORB demographic conflicts use 409 PatientDetailsMismatch (Connect and Update with NHS Login).
  - Documented removal of unused errorCode values DobMismatch / SurnameMismatch (these are not returned). fields dobMismatch / surnameMismatch on 422 DataMismatch.
  - On Connect by Email / by Link, when the patient already exists (email match), ORB validates dateOfBirth and lastName only.
  - Update Patient clarified:
    - without NHS Login — name/DOB may be overwritten;
    - with NHS Login — name/DOB locked; mismatch - 409 PatientDetailsMismatch.
- **List Patients filters (docs aligned to code)**
  - Invalid filter *combinations* are not rejected with 400 (dependency checks are not enforced). 400 remains for invalid pagination / invalid filter *values* (including nhsNumber format).
- **Widget / harness**
  - Widget can show an NHS-module-disabled experience when the organisation NHS module is off.

- If the organisation's NHS module is disabled in ORB, the clinician patient-records widget shows an ORB-hosted unavailable screen instead of NHS records.
- Access-token minting does not fail solely because the NHS module is off (no 403 NhsModuleDisabled on /access-token). The gate is inside the widget.
